During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation amotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature tabbe with thair source databases:

Bm: BMBL; Sw: SWISSPROT; Tr: TREMBL; Wp:, WORNPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep Clone-derived Length of mononucleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CR846094 175626 bp DNA linear VRT 26-MAY-2005
Zebrafish DNA sequence from clone CH211-264F16 in linkage group 24,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see thitp://www.sanger.ac.informing/brojects/D rerio/fishmask.shtml CH211-264F16 is from a CHORI-211 BAC library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Direct Submission

It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

AC124555 210174 bp DNA linear ROD 01-JAN-2004
Mus musculus BAC clone RP23-245K17 from chromosome 14, complete
                                                                                                                                                                                                                                                                                                                                                                                                                                               * NOTE: This is a 'working draft' sequence. It currently
* consists of 2 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 117197 117196: contig of 117196 bp in length
* 117297 199160: contig of 81864 bp in length.
* Location/Qualifiers
* contiguence of the preserved.

                   clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross misasemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.
                                                                                                                                                                                                     Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319
Consensus quality: 198828 bases at least Q40
Consensus quality: 198947 bases at least Q20
Insert size: 185000; agarose-fp
Quality coverage: 13.82x in Q20 bases; agarose-fp
Quality coverage: 13.82x in Q20 bases; sum-of-contigs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                               Submitted (14-JUN-2002) Genome Sequencing Center, 4444 Forest Park

College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On May 30, 2005 this sequence version replaced gi:63253308.
Sequencing is completed to a minimum standard of double strand
coverage with a minimum of 2 clones and 2 reads with no ambiguities
or 2 chemistries with a minimum of 2 clones and 3 reads with no
ambiguities. If the sequence quality does not meet this standard,
it will be indicated in the annotation. Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Euarchontoglires; Glires; Rodentia; Worley,K.C. Direct Submission Submitted (23-MAR-2005) Human Genome Sequencing Center, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 216621) Submitted (12-MAY-2005) Human Genome Sequencing Center, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases 1 to 216621) Sciurognathi, Muridae; Murinae; Mus. 1 (bases 1 to 216621)

The repeat regions shown were identified using RepeatMasker by

Sequence similarities were identified using Powerblast by Jinghui

Submitted (01-3AN-2001) Human Genome Sequencing Center, Department
Submitted (01-3AN-2001) Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Jan 1, 2001 this sequence version replaced gi:11875267.
Sequencing is completed to a minimum standard of double strand
coverage with a minimum of 2 clones and 2 reads with no ambiguities
or 2 chemistries with a minimum of 2 clones and 3 reads with no
ambiguities. If the sequence quality does not meet this standard,
it will be indicated in the amnotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence was intended or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, RMEL; Sw.; SWISSRYCI; Tr:, TREMBL; Wp:, WORWPEP; Information on the WORWPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononuclectide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.

Any regions longer than 1kb tagged as misc-feature 'unsure' are part of a tandem repeat of more than 10kb in length where it has not been possible to anchor the base differences between repeat copies. The region has been built up based on the repeat element to match the total size of repeat indicated by restriction digest, but respent copies may not be in the correct order and the usual breathers. Sext is from a Zebrafish BAC library

Baylor Plaza, Houston, TX 77030, USA

Day 0. 2002 this sequence version replaced gi:22772470.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Worley, K.C.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole senome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Baylor Plaza, Houston, TX 77030, USA
On Nov 15, 2002 this sequence version replaced gi:23269749.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, by sized gaps filled with Ns to the estimated size. The sequence by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* consists of 1 contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* I 249406: contig of 249406 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rattus norvegicus clone CH230-unknown, *** SEQUENCING IN PROGRESS ***, 7 unordered pieces.

 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a "working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrarty. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
 genome shotgun sequence reads. Both end sequences and whole genome

 and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a "working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 Submitted (12-5EP-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Sep 22, 2002 this sequence version replaced gi:21731862.
The sequence in this assembly is a combination of BAC based reads and whole genome shocqun sequencing reads assembled using Atlas (http://www.ngsc.bcm.tmc.edu/projects/rat/). As a result, the sequence may extend beyond the ends of the clone and there may be contigg that consist entirely of whole genome shocqun sequence reads. Both end sequences and whole genome shocqun sequence only contigs will be indicated in the feature table.
 Direct Submission
Submitted (23-JAN-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (Dase 1 to 346316)

The STS is derived from PCR amplicons generated from genomic DNA, sequenced from each end using the amplification primers. The sequence does not necessarily represent the entire amplicon. Sequence derived from PolyPhred was trimmed from each end of each unique contrig until five consecutive bases exceeded a quality score threshold of 20, and the next ten bases averaged a quality score of 20 or greater. Amplicon size was estimated by agarose gel

 The STS is derived from PCR amplicons generated from genomic DNA, sequenced from each end using the amplification primers. The sequence does not necessarily represent the entire amplicon. Sequence derived from PolyPhred was trimmed from each end of each unique contig until five consecutive bases exceeded a quality score threshold of 20, and the next ten bases averaged a quality score of 20 or greater. Amplicon size was estimated by agarose gel electrophoresis.

 g
 A85941 SNPs were
annotated with alleles from the boxer and the breed or canid from
which the particular
read came. The validation rate for these SNPs was estimated at
approximately 98%.
WGA-discovery (WGA) of Boxer/Poodle SNPs:
A second set of SNPs was generated using a similar methodology
except that the contigs
from the 1.5x poodle assembly (Kirkness 2003) were used instead of
WGS reads. Since this
sequence lacked base quality scores, arbitrary quality scores of
phred 40 were assigned
boxer assembly and SNP
boxer assembly and SNP
detection was carried out by SSAHA-SNP. 1637780 SNPs were annotated
with alleles from the
boxer and the poodle. The validation rate for these SNPs was
estimated at approximately TDB%.
Internal-WGA-discovery (I-WGA):
A third set of SNPs were discovered by comparing reads in the WGA
assembly. SNPs were
defined as mismatch positions that had a base quality of >= 30 on
both reads in a region
that aligned without gaps, and with at most one additional mismatch
in the ten flanking
bases. For each allele, at least one additional read had to confirm
it 731476 SNPs were
 German Shepherd, Rottweiler, Bedlington Terrier, Beagle, Labrador Retriever, English
Retriever, English
Shepherd, Ttalian Greyhound, Alaskan Malamute and the Portuguese Water Dog -100,000 each)
and five other canids (Chinese, Alaskan, Indian and Spanish Gray Wolf as well as the
Californian Coyote)
The WGS reads were placed uniquely on the CanFaml.0 boxer assembly carried out by SSAHA-SNP. 863872 reads were annotated as STSs and
 Protocol:
WGS-discovery (WGS):
Paired-end low-coverage whole genome shotgun reads were generated
from 9 breeds
Whitehead Institute for Biomedical Research, Center for Genome
 annotated with alleles between the two boxer alleles. The validation rate for these SNPs was estimated at approximately TBD%.

The invention describes a new isolated polymucleotide (I) encoding a polypeptide with biological activity comprising: a nucleotide sequence of SEQ Inuly defined); a nucleotide sequence that hybridizes to the sequence of (i) under stringent hybridization conditions; or a nucleotide sequence of (i) under stringent hybridization conditions; or a nucleotide sequence of (i). Also described are: a (n) (expression) vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polymucleotide in the host cell; an isolated polypeptide comprising a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide (is: a polypeptide encoded by (I); or a polypeptide encoded by a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide of (3) and a sequence of SEQ ID NOS: 1-567; a composition comprising the polypeptide of (3); a method for identifying a complomed of (3); a method for identifying a compound that binds to the polypeptide of (3); a method for identifying a compound that binds to the polypeptide of (3); an explosition of polymucleotides, where the collection comprising of at collection of polymucleotides, where the collection comprising of at the sequences of SEQ ID NOS: 1-567. (I) is a polymucleotide comprising of at cleast one of SEQ ID NOS: 1-567. (I) is a polymucleotide with biological cativity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polymucleotide comprising of sequences and methods are fully defined in the specification. The sequences and method seare useful for treating a disease or disorders or other traits, in assessing biodiversity, and for producing many other traits, in assessing biodiversity, and for producing man of sequences conditions and method are useful for treating a disease, burns, CNC e-go osteoporosis, viral infection, or cancer. This sequence encodes a current infection, or cancer. This sequence encodes a cativity of the invention of c

The present invention describes human nucleic acid-associated proteins designated NAAP-1 to NAAP-57. The human NAAPs have cytostatic, antiarteriosclerotic, anti-HIV, antiallergic, cerebroprotective, antiparkinsonian, anticonvulsant, nootropic, neuroprotective, antinatentory, ophthalmological, thyromimetic, antiarthritic, hepatotropic, antibacterial, virucide, protozoacide, antiparasitic and implicate activities, and can be used in gene therapy. The NAAP protein and polymucleotide sequences can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (Parkinson's disease, Alzheimer's disease, stroke, epilepsy), developmental disorders (renal tubular acidosis, anaemia, glaucoma,
New human nucleic acid-associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression, e.g. cancer, hepatitis, AIDS, atherosclerosis,

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed its a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesishing the polynucleotide, or as a probe for detecting the polynucleotides and encoded for detecting the polynucleotides and encoded genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression, and activity, or as targets
 encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The CDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a CDNA of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies to produce probes for detection of mRNA and to produce additional copies or antisense oligonucleotides. The probes can be used for chromosome mapping of the polynucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventions. The polynucleotides, polypeptides and preventive interventions. The polynucleotides, polypeptides and treat the cancers and proliferative disorders such as neoplasia, caysplasia and hyperplasia

 New breast specific nucleic acids and proteins, useful for identifying, diagnosing, monitoring, staging, imaging, and treating breast cancer and non-cancerous disease states in breast tissue, and in gene therapy.
 The present invention provides human breast specific coding sequences and proteins. These can be used in the diagnosis and treatment of breast cancer and non-cancerous diseases of the breast. The present sequence is a coding sequence of the invention

AMK54951 to AAK64702 encode the human immune/haematopoletic antigen (I)
amino acid sequences given in AAM8170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
croteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
colynucleotides may be used to produce the secreted (I), by inserting the
polynucleotides may be used to produce the secreted (I), by inserting the
protein. (I) proteins and polynucleotides may be used to prevent,
cdiagnose and treat immune/haematopoietic-related diseases, especially
concers and cancer metastases of haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAX54942 to AAX54950 and AAM82169
represent sequences used in the exemplification of the present invention
 Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.

are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of binding to Carcinoma Associated Protein (CAP); (iii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (vii) for treating carcinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 30% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a nucleotide sequence of the invention.

This invention relates to a novel method for modulating the expression of a target gene in a cell. Specifically, it refers to the introduction into a call of a polymouleotide that forms a duplex region with an mRNA transcribed from the target gene, where the duplex region comprises a mammalian miRNA target region i.e. a non-coding microRNA (miRNA) that regulates mRNA at a post-transcriptional level. The present invention describes a method for controlling ontogenesis of a mammal, function of a mammalian cell, differentiation of a mammalian cell in the post-transcriptional phase, which comprises introducing a plasmid vector comprising a promoter and nucleic acid molecule expressing an miRNA or siRNA silencing precursor to the miRNA. Accordingly, it provides a cell therapy method for treating cancer, manda disease, nerve disorder (e.g. amyotrophic lateral sclerosis, parkinson's disease, or Alzheimer's disease) or an inflammatory disease by introducing into the cell the miRNA, siRNA silencing precursor to the

The invention relates to a novel method for in vitro detection of systemic inflammatory response syndrome (SIRS). The method comprises detecting abnormal expression of disease-related genes, or their associated peptides. The method of the invention demonstrates antibacterial, immunosuppressive and antinflammatory applications and may be used for early differential diagnosis, monitoring progression, assessing risk, assessing the likely response to treatment and for post mortem diagnosis of systemic inflammatory response syndrome, sepsis and seguences of the invention. The recombinant or synthetic nucleic acid sequences of the invention, or derived proteins or peptides, may be useful as calibrants in assays for the specified diseases, for evaluating activity or toxicity in screening for active agents and/or for preparation of agents for treatment or prevention of the specified diseases. The current sequence is that of a human SIRS/sepsis diagnostic
miRNA or the plasmid vector. As such, they can be developed into pharmaceutical compositions that exhibit cytostatic, immunosuppressive, noortopic, neuroprotective and antiinflammatory activities and hence can be used for immunocherapy. This polymucleotide sequence is a human target gene whose expression is modulated by miRNAs of the invention.
 In vitro detection of systemic inflammatory response syndrome and related conditions, for e.g. monitoring progression, comprises detecting abnormal expression of disease-related genes.

New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in a mammal.

Claim 1; SEQ ID NO 2426; 3069pp; English.

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.

```
The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding forkhead box 01A, where the compound is at least 70% complementary to a nucleic acid molecule encoding forkhead box 01A and modulates expression of forkhead box 01A by at least 10%. The compound is useful for treating an animal having a disease or condition associated with forkhead box 01A, e.g. a hyperproliferative disorder (cancer, preferably rhabdomyosarcoma), or type 2 diabetes. This sequence corresponds to the human foxhead box 01A to which the oligonucleotides of the invention are targeted.

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are coverexpressed in cancer tissues compared to normal tissues, and may thus service as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide cacid and polypeptide and polypeptide and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide occupancy opolypeptides, expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; usion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or attibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with carcased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cancers such as breast cancer, colorectal cancer, lung cancer, cervical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, malanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence
 New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or

The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
 Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comprises determining the expression profile of a group of markers in a

AAS74720/c
 The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, ollogemers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polypurcleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodievesity
 and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invantion. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

polymoclectide sequences and their encoding polymetrical inventor interpretation tenders by the polymetric experiments and their encoding polymetric interpretation, cell differentiation, antiinflammatory, and stem cell polymetrides exhibit activities. The polymetrides are involved in the growth factor activities. The polymetrides are involved in the proliferation, differentiation and aurvival of pluripotent and totipotent stem cells, and are useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals and development of bio-sensors. The polymetrides can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmume disease, accidental damage or genetic disorders. The polymetrides induce the proliferation of neural cells and regeneration of nerve and brain tissue and are useful for the treatment of central and peripheral nervous system and seases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis (ALS). The polymetrides are also involved in chemotactic or chemokinetic activity,

regulation of haematopoiesis and are useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia and cor regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, and periodonital disease. The polypeptides are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders (e.g. multiple sclerosis, rheumatoid athritis, diabetes mellitus, myashenia gavis), allergic reactions and conditions, such as asthma or other respiratory problems. The polypeptides are involved in thrombolysis or thrombosis and are useful in treatment of various coagulation disorders (including hereditary disorders such as haemophilia) or to enhance coagulation and other creatment of various coagulation disorders (including hereditary or ther causes. The polypeptides exhibit immune stimulating or immune suppressing activity, and are useful for treating autoimmune diseases or cancer. They also inhibit the growth, infection or function of infectious agents such as bacteria, fungi, viruses, effect blorhythms or circadian cycles of thythms, fertility of male or femmale subjects, metabolism, catabolism, and anabolism. Achosesz-Achosoz represent novel contigs assembled using expressed sequence tag (EST) sequences as seeds. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease both or RNA. The purified polypeptide is useful for generating antisease of the printed sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides.

Conficiencies are described for each of the 101 polymucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, contendegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, levelopmental abnormalities and fetal deficiencies, blood disorders, levelopmental, scholmental, prostate callergies, Alzhaimer's and cognitive disorders, pulmonary disorders, callergies, skeletal or cardiac muscle disorders, pulmonary disorders, transplant rejection, disorders involving osteoclasts such as costeoporosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS: The human secreted proteins of the invention are represented in AAX37451-X37552

 The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded to hovel central nervous system protein. (I) and polypeptides (III) encoded a pathological condition. Disorders which are disquosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease and anglogenesis, nervous system disorders e.g. Alzheimer's disease and amglocation, gastrointestinal disorders e.g. dysphagia, c.g. or corneal infection, gastrointestinal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. cempiratory disorders involving neovascularisation e.g. malignancies, respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. cette kidney failure and blood related disorders e.g. myocardial cinfarction. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplanters. for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

The invention relates to novel mucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (EILISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. Construint and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial corders before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease corla polype or diseases and disorders treated by the nucleic acids and corders are given in the specification. The present sequence encodes a crocken antigen of the invention. Note: The sequence data for this patent corder and once in the specification, but was obtained in New polynucleotides and polypeptides for diagnosing, treating, preventing or prognosing e.g. diseases or disorders of the nervous, musculoskeletal, excretory, gastrointestinal, reproductive, and respiratory systems. Claim 1; SEQ ID NO 635; 642pp; English. Ruben SM; 05-JAN-2001; 2001US-0259678P. (HUMA-) HUMAN GENOME SCI INC. Rosen CA, Barash SC, WPI; 2001-488782/53. P-PSDB; AAU21291.

The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 954 identical to a these. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to displace a pathological condition or susceptibility to a condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic in alleviating symptoms associated with the disorders and in diagnostic (BLISA). Disorders which are diagnosed or treated immunosorbent assays (BLISA). Disorders which are diagnosed or treated imclude autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by actreative virtuess and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxie. The polypeptides can also be used as a food additive or preservative to increase or decrease conservative conservative conservative conservative conservative conservative conservative conservative conservative conservative conservative conservative conservative conservati

The invention describes an isolated polypeptide comprising an amino acid sequence at least 90% identical to: a polypeptide fragment, domain, epitope, or full-length protein of any one of 607 amino acid sequences (I) described in the specification; a polypeptide fragment of (I), or the encoded sequence contained in (II), having biological activity; or a variant, allelic variant, or a species homologue of (I). The polypeptides and nucleic acid molecules are useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions such as neural disorders, e.g. Alzheimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis or multiple sclerosis,
 New polypeptides and nucleic acid molecules, useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating medical conditions e.g. neural disorders, reproductive disorders or infectious

 The invention relates to novel genes (ABL89449-ABL90853) and proteins

(ABB89040-ABB90444) useful for preventing, treating or ameliorating

cmedical conditions e.g. by protein or gene therapy. The genes are

isolated from a range of human tissues disclosed in the specification.

The nucleic acids, proteins, antibodies and (ant) agonists are useful in

the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and

covarian cancer and other cancers of the adrenal gland, bone, bone marrow,

covarian cancer and other cancers of the adrenal gland, bone, bone marrow,

breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune

disorders e.g. Addison's disease, allergies, autoimmune haemolytic

candiovascular disorders such as mycoardial ischaemias; (d) wound healing

cardiovascular disorders such as mycoardial ischaemias; (d) wound healing

cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f)

infections. Note: The sequence data for this patent did not form part of

the printed specification, but was obtained in electronic format directly

Compositions for treating and diagnosing cancer, contain agents that inhibit activity or expression of specific tumor-associated antigens, or bind to these antigens or nucleic acid encoding them.

Claim 1; SEQ ID NO 69; 388pp; German.

This invention relates to a novel pharmaceutical composition which comprises an agent that inhibits the activity or expression of a specific tumor-associated antigen (TAG). Specifically, it relates to tumor-associated antigens that are encoded by one of the following 75 nucleic acids sequences, fragments or derivatives thereof as given in the specification. The present invention describes antisense nucleic acids 

```
that hybridize to these TAg polynucleotides that may be used for antisense therapy and RNA interference, as well as methods for diagnosing a disease associated with (abnormal) expression of TAG. Accordingly, it further relates to methods for determining regression, progression and onset of a disease by administering an antibody, optionally linked to a therapeutic or diagnostic agent, that binds to TAG. As such, cytostatic compositions derived thereof are used for treating a wide range of cancers and their metastases, where the agents that bind specifically to TAG, and the nucleic acids that encode them, are useful for diagnosis and monitoring. This polynucleotide is a human DNA sequence encoding a tumor associated antigenic protein of the invention.
 New genes that are up- or down-regulated in colorectal cancer, useful for diagnosing colorectal cancer in a subject, or for identifying modulators of colorectal cancer-associated proteins and genes for treating colorectal cancer.

The present sequence is the nucleotide sequence of a human gene that exhibits increased expression in metastatic colorectal cancer (MCC) samples. The gene is up-regulated in colon cancer-derived metastases compared to normal colon tissue. It is an example of claimed nucleic acid molecules that are up- or down-regulated in metastatic colorectal cancer cells. Such MCC-associated nucleic acids are useful in diagnostic and prognostic applications, in screening applications e.g. blochips, for identification of variant MCC-associated sequences, in informatics, for expression of MCC-associated proteins, in drug screening assays for identification of modulators of MCC-associated proteins, which are useful
 for treating this cancer, in gene therapy, as \bar{DNA} vaccines, and as antisense or ribozyme modulators of MCC

Inhibiting the growth or proliferation of a colon neoplasia in a subject, for treating colon cancer, comprises administering to the subject an agent that decreases the amount of a polypeptide present in or produced the colon neoplasia

Claim 3; SEQ ID NO 9; 125pp; English

```
The present sequence is the nucleic acid sequence of ColoUpS a molecular marker of colon neoplasia. ColoUpS was identified by expression microarray profiling of genes showing differential expression in normal colon and metastatic colon cancer. ColoUpS is referred to in the literature as FoxQl (Forkhead box subclass g, member 1, formerly known as HFH-1), which plays a role in tissue-specific gene regulation and development, cell cycle regulation, cell signalling and tumourigenesis. The molecular marker is useful in the detection or diagnosis of colon neoplasia and for categorising the neoplastic state of a patient. Methods for inhibiting the growth or proliferation of a colon neoplasia involve the use of short interfering RNA (siRNA) or antisense oligonuclectides, or an agent that binds to and antagonises the pollypeptide. Molecular markers can also be used to target therapeutic agents to cells of a colon neoplasia, and to screen and identify candidate therapeutic agents.
 The invention relates to novel molecular markers for categorizing the neoplastic state of a patient. The invention further comprises a method for detectring whether a subject is likely to have a colon neoplasia. The method comprises: obtaining a biological sample from the subject; detecting one or more polypeptides selected from among: one or more
 molecular marker; neoplastic state; colon neoplasia; ColoUp1; ColoUp2;
 Detecting likeliness of subject to have colon neoplasia, involves obtaining biological sample from subject, detecting one or more of ColoUpl and ColoUp2 polypeptides, presence of polypeptide indicating

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 1850-9691 represent a set of about 7842 genes or partial genes from the genome of the bacterium Mxyococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
ColoUpl polypeptides and one or more ColoUp2 polypeptides, wherein the presence of said one or more polypeptides is indicative of colon neoplasia. The invention further comprises a kir for carrying out the said method. The methods and compositions are useful for detecting colon cancer. This polynucleotide sequence represents the ColoUp5 gene of the
 New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing

 The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 95% identical to a these. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to display a pathological condition or susceptibility to a care pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic in alleviating symptoms associated with the disorders and in diagnostic in alleviating symptoms are diagnosed or treated immunosorbent assays (ELISA). Disorders which are diagnosed or treated immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. creating carrest, cerebrovascular disorders e.g. cerebral ischemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in Chemotaxie. The polypeptides can also be used as a food additive or preservative to increase or decrease encorage.
 Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.

WPI; 2001-581633/65. P-PSDB; AAU87259.

New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 1; SEQ ID NO 179; 837pp; English

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (II), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Acquired immunodeficiency virus (AIDS) and fund; ocular disorders e.g. Acquired immunodeficiency virus (AIDS) and fund; ocular disorders e.g. testicular feminisation, endocrine disorders e.g. disphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders e.g. nonallergoic rhinitis, renal disorders e.g. cesticular feminisation, endocrine cis malignancies, crespiratory disorders e.g. nonallergoic rhinitis, renal disorders e.g. myccardial infarction. The polypeptides can also be used to aid wound healing and ceptimal organs before transplantation, for supporting cell culture of primary tissues. to respensate tissues and in chemotaxis. The collypetides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,

The present invention relates to a nucleic acid molecule encoding a UST3-LIKE1 or its regulator is useful for the treatment of gastrointestinal and liver diseases, metabolic diseases, hematological disorders, respiratory diseases, neurological disorders and cardiovascular diseases in a mammal. The regulator is a famal molecule, an RNA molecule, an antisease oligonucleotide, a polypeptide, an antishody, or a ribozyme. The disorders include liver cirrhosis, liver tumours, achalasia, dysphagia, gastroesophageal reflux, diabetes, crohn's disease, diarrhes, constipation, seteoporosis, Alzheimer's disease, Parkinson's disease, anemia, leukemia, lymphomas, asthma, allergies, stroke, dementia and arrhythmias. The present sequence

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a transformed plant to such as maize or soybean. The method of producing a plant with the cacombinant DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plants with construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plants with carecased plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme commotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the content, improved yield by modification of carbohydrate, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved lightin production or improved galactomannan content in proved lightin production or improved dighting production or improved dighting sequence represents a bacterial polynucleotide used in the scope of the invention. Onte: The sequence data for this patent did content form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic format from USPTO at sequence.

The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed centry of (II) is useful in gene therapy techniques to restore normal genes. (I) is useful in gene therapy techniques to restore normal cuseful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging (I) of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, foremists, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amin on original and the produce other types of data and products dependent on DNA and amin or marging of amino acid sequences. AAS64157-AAS94564 represent nowel human diagnostic
 coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in game therapy. The human diagnostic and therapeutic polynucleotides (dith) or polyneptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or disorder, neurological disorders, developmental disorders, or cisorder, neurological disorders, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline the invention. Note: The sequence represents a dithp polymorleotide of the invention. Note: The sequence represents a dithp polymorleotide of the invention. Note: The sequence represents and for sepresented in the printed specification, but was obtained in electronic format

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a plant construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing matations in a gene of interest sequences given in records for SEQ IDs 1-1849 represent a set of 1849 contig and singleton sequences comprising coding sequences, the geneme of the bacterium Mayococcus xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
 New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.

WPI; 2001-476224/51.

prognosing respiratory cancers Isolated polypeptide for treating, preventing and/ or disorders related to the respiratory system including and also for testing and detection e.g. diagnosis.

Disclosure; SED ID No 960; 546pp; English.

The present invention relates to the isolation of novel human respiratory antigens (AAU17685-AAU17975), and cDNA and genomic sequences encoding for these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the tespiratory system including throat disorders e.g. vocal cord paralysis, tonsillitis, and laryngitis), lung disorders e.g. pneumonia, allergic disorders and cancers of the respiratory tissues e.g. pneumonia, allergic disorders and cancers of the invention are useful in gene therapy and antisense therapy. AAS28161-AAS28764 represent genomic sequences encoding for novel human respiratory antigens. Note: The sequence encoding for movel human tespiratory antigens. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at

techniques, for chromosome identification, identifying individuals from

```
The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (FS) and having biological activity, polypeptide domain or epitope of FS, full-length protein of FS, or variant, allelic variant or species homolog of FS. (I) cr a polymucleotide (II) encoding (I) is also useful for diagnosing a pathological condition or a ususceptibility to a pathological condition in a subject which involves determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a biological sample and diagnosing a pathological condition based on the result. The human respiratory system associated polymucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., pneumonia), allergic disorders, (e.g., asthma and eosinophilic pneumonia), pleurisy, cystic (fibrosis, emphysema, histicoytosis, pneumonia), pleurisy, cystic (fibrosis, emphysema, histicoytosis, cancers of respiratory tissues (e.g., throat cancer, lung cancer, and cancer of the nose). The polymucleotides are useful in gene therapy
 Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat

WPI; 2003-902033/82.

Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat cancer.

Disclosure; SEQ ID NO 960; 236pp; English.

The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of PS, full-length biological activity, polypeptide domain or species homolog of PS. (I) cordition or a susceptibility to a pathological condition in a pathological condition or a subject which involves determining the presence or absence of mutation a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation or cault. The human respiratory system associated polymucleotides, the creatif. The human respiratory system associated polymucleotides, the creation and/or these polypeptides are useful in diagnosis, treatment, prevention and/or these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., pneumonia), allergic disorders, (e.g., asthma and ecsinophilic pneumonia), pleurisy, cystic fibrosis, emphysema, histiocytosis, arcoidosis, nose disorders (rhinitis and sinusitis), neoplasms and/or cancers of respiratory tissues (e.g., throat cancer, lung cancer, and cancers of the nose). The polymucleotides are useful in gene therapy techniques, for chromosome identification, identifying individuals from

This invention is related to a novel isolated polypeptide, which comprises a human respiratory system-related polypeptide, and the DNA sequence which encodes it. The invention may be useful for the development of compounds with an antiasthmatic, antibacterial, antiinflammatory, cytostatic, antianaemic or antiallergic activity. In addition, the sequences disclosed may be useful for gene therapy. The polypeptide or polymucleotide is useful for treating, preventing or ameliorating a medical condition, for example pneumonia, lung cancer, cystic fibrosis, astroma, sarcoidosis, rhinitis, ansemia, leukaemia, inflammations, sinusitis, chronic obstructive pulmonary disease or infectious diseases. The polypeptide or polymucleotide is also useful for diagnosing any of these diseases or a susceptibility to the disease. The present sequence is that of a human DNA sequence which is related to a human respiratory system associated gene of the invention.

The invention relates to a substantially purified nucleic acid molecule recoding a nitrite reductase of SEQ ID NO. 11256. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest sequences given in records for SEQ IDs 1-1849 represent a set of 1849 contig and singleton sequences comprising coding sequences, the genome of the bacterium Mycoccous xanthus. Note: The sequence data for this patent did not form part of the printed specification, but was

 The invention relates to a new combination which comprises cDNAs or their complements not given in the specification that are differentially expressed in vascular endothelium. The combination of cDNAs is useful for preparing a composition for diagnosing or treating vascular disorder, comprising atherosclerosis, haemangioma, haemangioendothelioma, oedema, diabetic retinopathy, warts, pyogenic granulomas, Kaposi's sarcoma, scar keloids, allergic oedema, neoplasms, psoriasis, ulcers, follicular cysts endometriosis, peritoneal sclerosis or obesity. The present sequence
 New combination comprising cDNAs that are differentially expressed in vascular endothelium, useful for preparing a composition for diagnosing or treating vascular disorder, e.g., atherosclerosis, psoriasis, ulcers
 wart;
 Murine cDNA differentially expressed in MYCN activated cells SeqID 349.
 represents a cDNA differentially expressed in the vascular endothelium.

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymoleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protonorm cells activated by the transactivator MYCN, where MYCN is a protonorm cells activated by the transactivator MYCN, where MYCN is a protonorm cells and is common in small cell lung cancers. The present invention describes these CDNA molecules cell lung cancers. The present invention describes these CDNA molecules can seful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that expecifically bind the CDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymocleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the DY Patent Office at
New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment represents a cDNA efficacy of treatment. The present sequence represents a cDNA

The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high throughput method of screening molecules or compounds to identify a throughput method of screening molecules or compounds to identify a wilson disease and comparison of a standard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises combining the combination with molecules or compounds under conditions to allow specific binding; and detecting specific binding between each cDNA and at compound. The molecules or compounds are regulatory proteins. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human cDNA which is differentially expressed in steroid-induced CSNA liver cells. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic sact sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.  The specification describes polynucleotides which are associated with melanoma and thyroid tumors. Specifically, these are MEL3, MEL7, Thy5, Thy11, Thy14, and Thy15. The polynucleotides are useful for diagnosing and treating a patient with melanoma, thyroid tumour, rectal cancer, lung cancer, breast cancer or colon cancer. The present sequence represents a polynucleotide of the invention
 for detecting prostate cancer. This sequence represents a human prostate cancer cDNA of the invention.
 Melanoma; thyroid tumour; MEL3; MEL7; Thy5; Thy6; Thy11; Thy14; Thy15; rectal cancer; lung cancer; breast cancer; colon cancer; antibody Ki-67;
 Novel isolated nucleic acid molecules for diagnosing and treating melanoma, thyroid tumors, rectal, lung, breast and colon cancers.
 cDNA sequence encoding the antigen of monoclonal antibody Ki-67.

 The present invention describes a method (MI) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent con the foranti-neoplastic activity, determining a change in capression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used for proplucing a producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous tumour
 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.

The invention relates to an isolated cDNA expressed during adipocyte differentiation. The CDNA is useful for treating a subject with a disorder such as obesity, type II diabetes, lipodystrophy or hyperinsulinaemia. The nucleic acid is useful for a high throughput method of using a cDNA to screen several molecules or compounds to identify a ligand which specifically binds the CDNA which involves combining the nucleic acid with several molecules or compounds under conditions to allow specific binding, between each cDNA and at least one molecule or compound, thus identifying a ligand that specifically binds to each cDNA. The several molecules or compounds are chosen from DNA molecules, RNA molecules, peptides in a ligand that specifics peptides. Transcription factors, repressors and regulatory proteins. The present sequence represents a human cDNA expressed during adipocyte differentiation.

This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) comprises contacting endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation in at correlates with lymphoedema in human subjects, and with the provise that the LEC protein is not VEGRP-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGR-C or VEGP-D polypeptides and polynucleotides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, vasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells, in treating hereditary of a drug on endothelial cells. The agent is useful in manufacturing a medisoment for the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a cell or lymphatic yessel endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases and cancer metastasis via the lymphatic cystem or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatic cystem or of other diseases involving the lymphatic vessels. This result sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the repetioning.

 This invention relates to a novel isolated nucleic acid associated with bronchial cancer comprising 489 defined sequences given in the pronchial cancer comprising 489 defined sequences given in the specification. The invention may be useful for the production of compounds with a cytostatic activity through the inhibition of expression or activity of tumour-associated proteins. The novel DNA sequences and the proteins/peptides encoded by them are used for detecting bronchial cancer or determining the risk of developing it and to soreen for specific binding partners of the DNA or protein sequences, where the binding partners are potentially useful as agents for treating or diagnosing bronchial cancer. The DNA or protein sequences can also be used for prognosis, detection of metastases and for secondary treatment of tumours that have been stabilised or are no longer detectable). Detecting abnormal expression of the DNA sequences provides early diagnosis of bronchial cancers. The present sequence is that of a novel

the the range of the responding to an anti-cancer agent that modulates cyclin-dependent kinase (dk) activity. The method comprises measuring the level of one or more blomarkers selected from 2774 blomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed microarrays comprising the biomarkers described, antibodies directed microarrays comprising the biomarkers and a cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[[5-(1,1-Dimethylethyl)-2-caracid salt. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fly wipo.inft was obtained in electronic format directly from WIPO at fly wipo.inft the method of the invention.

 The invention relates to a novel method for characterizing the state of a neoplastic disease in a subject comprising determining the pattern of expression levels of at least 6, 810,15,20,30,47 or 67 marker genes in a biological sample, comparing the pattern of expression levels with reference patterns of expression levels and characterizing the state of the neoplastic disease in the subject from the outcome of the comparison. The method of the invention demonstrates cytostatic applications and may be useful in characterizing the state of a neoplastic disease in a subject, preferably breast cancer, in gene therapy and for screening for compounds having a curative effect on a neoplastic disease. The current sequence is that of the human breast cancer marker MKIG7 DNA of the invention which is differentially expressed in neoplastic tissue.

Tumour-associated antigenic target (TAT) cDNA DNA325386, SEQ ID NO:3074.

(first entry)

18-NOV-2004

ACN39127;

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; nucleic acids, antagonists, binding molecules and compositions are useful antibodies, antagonists, binding molecules and compositions are useful increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence Tumour-associated antigenic target; TAT; human; overexpression; cancer; tumour; diagnosis; cell proliferative disorder; breast cancer; colorectal cancer; lung cancer; ovarian cancer; liver cancer; central nervous system cancer; bladder cancer; pancreatic cancer; cervical cancer; melanoma; leukaemia; hybridisation probe; chromosome identification; chromosome mapping; gene mapping; New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or Sequence 12674 BP; 4164 A; 3103 C; 3017 G; 2390 T; 0 U; 0 Other; 00000 Matches: Conservative: Mismatches: chromosome identification and in gene therapy. represents a TAT nucleic acid of the invention Length: Indels: 5312 GCTCTTCTTTCACGCCCACTTTCCCCA 5286 Claim 1; SEQ ID NO 3074; 7273pp; English.  The invention relates to a compound targeted to a nucleic acid molecule encoding prox-1 and inhibits the expression of prox-1. The compound, composition and methods are useful for treating a disease or condition associated with prox-1, such as a developmental disorder e.g. Usher Syndrome Type II, or an ocular disorder, e.g. retinal degradation or retinitis pigmentosa. They are also useful in research and diagnostics for modulating the expression of prox-1. The present sequence represents a human PROX-1 DNA.
 New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding prox-1 useful for treating a disease or condition associated with prox-1, e.g. cancer, Alzheimer's disease or neurodegenerative disease.
 Screening, diagnosis and therapy of colon tissue for a pathological condition, e.g. colorectal cancer, where elevation of transcription factor Prox-1 expression correlates with a pathological phenotype.

The invention relates to a method of screening colon tissue for a pathological condition which comprises measuring Prox-1 expression in a biological sample that comprises colon tissue from a mammalian subject, where elevated Prox-1 expression in the colon tissue correlates with a pathological phenotype. The molecule that suppressed expression or treatment of colorectal cancer. The inhibitor of Prox-1 function in mammalian cells is useful for the manufacture for inhibiting Prox-1 function. The siRNA molecule is useful in the manufacture for inhibiting Prox-1 function. The siRNA molecule is useful in the manufacture of a medicament for the treatment of colorectal cancer. The present sequence represents the human Prox-1 genomic DNA.

The invention discloses an isolated human transporter polypeptide, and its allelic variants or orthologues, and the polymucleotides encoding them allelic variants or orthologues, and the polymucleotides encoding concluding cell proliferation, differentiation and signalling processes, including cell proliferation, differentiation and signalling processes, by regulating the flow of molecules, such as ions and macromolecules, into and out of cells. The polymucleotide and polypeptide can be used to raise antibodies, create a gene chip, create a transgenic non-human animal, produce the novel polypeptide, detect the presence of the polypeptide or nucleic acid in a sample, identify a modulator of the polypeptide or uncleic acid in a sample, identify a modulator of the composition, and carrier, that binds to the polypeptide and treat a disease or condition mediated by a human transporter protein which composition, and carrier, that binds to the polypeptide and nucleic acid a patient the composition identified. The peptides and nucleic acid a patient the composition in the development of human therapeutics and diagnostic compositions. The peptides are also useful for eliciting an immune response, to quantitatively determine levels of the protein (or its binding partner or ligand) in biological fluids or as markers for the agents identified are useful for treating transporter-related conditions and a modulator of the peptide is also useful for treating a disorder characterised by an absence of, inappropriate or unwanted expression of the protein. The sequence presented is the human
 New isolated human transporter proteins, useful for developing therapeutic or diagnostic compositions, particularly for developing human therapeutic agents that modulate transporter activity in cells or

The invention relates to recombinant (ADAD1482-ADAD3094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA muclaic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a biochip comprising CA muclaic acid or fragments thereof. The sequences of the invention were identified using concepenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or a random. Many of these do not carry transduced host oncogenes or a random. Many of these do not carry transduced host oncogenes or direct consequence of the effects of proviral integration into host protoconcegenes. The CA nucleic acid sequences can be used to diagnose arctinoma (especially breast cancer, prostate cancer, includence of accidence is a direct onsequence of the breast cancer, protoconcedence of the sequence of a CA gene expression in particular tissues. CA mucleic acids, proteins and antibodies are also useful as theresent sequence represents a specifically claimed murine CA nucleic acid present sequence of the invention. Note: The complete sequence data for this expending not evaluating drug candidates. The patent did not form part of the printed specification, but was obtained in electronic format directly from WIPPO at

 The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinomassociated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADCB5215-

 The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence salected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention.

The invention relates to new recombinant nucleic acids. The invention clates to a host cell comprising a recombinant nucleic acid or also relates to a host cell comprising a recombinant nucleic acid, a recombinant protein, a method of screening for dryg candidates, a method of screening for a bicactive agent capable of binding to a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma drug, a method of evaluating the effect of a CAP, a method of evaluating the effect of a candidate carcinoma drug, a method of diagnosing carcinoma, a method of carcinoma drug carcinoma Amethod of the activity of a CAP, a method of diagnosing carcinoma or propensity to carcinoma. A method of treating the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the expression of the gene comprising the expression of the gene from the patient and determining alterations in the expression of a first individual and comparing the expression of the gene from the diagnosing carcinoma comprising the expression of the gene from the first individual and comparing the expression indicates that the first individual has carcinoma. A method of inhibiting the carcinomas comprises administering to a patient an inhibitor of CAP.

Neutralising the effect of a CAP comprises contacting an agent specific carcinomas comprises binding an inhibitor to the CAP. The polypeptide specifically binds to the protein encoded by the nucleic acid. It comprises an antibody that specifically binds to the protein encoded by the nucleic acid in the uncleic acid. The nucleic acid are useful for the protein encoded by the nucleic acid fithe patent an inhibitor of CAP.

Special account of the polypeptide acid fithe invention and account and account and accou

 Submitted (17-ANG-2004) MIPS, Ingolstaedter Landstr.1, D-85764
Neuherberg, GERMANY
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Email s.wiemannagkfz-heidelberg.de;
sequenced by DKFZ (German Cancer Research Center,
Heidelberg/Germany) within the CDNA sequencing consortium of the
German Genome Project. This clone (DKFZp686B17277) is available at
the RZPD beutsches Ressourcenaentrum fuer Genomforschung GmbH in
Berlin, Germany. Please contact RZPD for ordering:
http://www.rzpd.de/cgqi-bin/products/cl.cgi?CloneID=DKFZp686B17277
Futther information about the clone and the sequencing project is
available at http://mips.gsf.de/projects/cdna/.

 Direct Summission.

Computational Analysis of Full-Length Mouse CDNAs Compared with Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to
 prepare mouse tissues.

Tissues were provided by Kirk W. Beisel (Boys Town National Research Hospital 555 North 30th Street Omaha,NE 68131 USA) whose assistance we gratefully acknowledge.

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NorI site and the oligo-dT track served to identify it as a clone from the normalized corpus striatum library CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP CDNA clones, this record will be updated accordingly when that means is determined. Seg primer: M13 Forward

Site_2: Not I; The library was constructed according
Sonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with oligo-qr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with NotI and then cloned
directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is TGAGAGAGCC. This library was created for the University
lows Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Haalth (NIMH), Hemin Chin, Ph.D.,
program coordinator."

DR647955 757 bp mRNA linear EST 12-JUL-2005 EST1038072 FvN Gibberella moniliformis cDNA clone FVNAD49, mRNA
 Another Tablue Script II SK(+) XR; Site_1: BCORI; Site_2: Xhol; anamorph: Fusarium verticillioides. Library Site_2: Xhol; anamorph: Fusarium verticillioides. Library Fav was obtained from RNA derived from a corn meal medium culture of strain M-3125. These cultures were prepared by inoculating an autoclaved mixture of 25 g corn meal and 5 and distilled water with 5 ml of water containing 5 x 10e7 condia. The inoculated medium was mixed thoroughly, distributed equally into two 100-mm plastic petri dishes, and incubated at room temperature for four or six days."

RNA prepared and library constructed by W. Walter Lorenz, School of Porestry, University of Georgia; plant material prepared at the Porestry, University of Georgia; plant material prepared at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.

Seq primer: JENREV (CAGGAAACAGGTATGACC).
 Eukaryota; Fungi; Ascomycota; Pezizomycotina; Sordariomycetes; Hypocreomycetidae; Hypocreales; Nectriaceae; Gibberella.

Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT713-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT) B tail. The sequence tag for this library is GAAAGGCTAGT. Tissue was obtained from the Provasoli-Guillard National Center for Culture of Marine

 06:24:31 ; Search time 505 Seconds (without alignments) 746.224 Million cell updates/sec
 is the number of results predicted by chance to have a
tter than or equal to the score of the result being printed,
ived by analysis of the total score distribution.

 Search time 1251 Seconds (without alignments) 395.141 Million cell updates/sec
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
